Gemini Notebook

```
DEVELOPER TRANSLATION:
Factories = The Platform Team shipping the build.
Sales Subsidiary = A Regional Deployment.
Biz Ops = The Integration/Middleware layer between supply and client sales.
Accounts = Client systems consuming your API.
```

Gemini Notebook

DEVELOPER TRANSLATION:

Sell-In = Messages published to a queue.

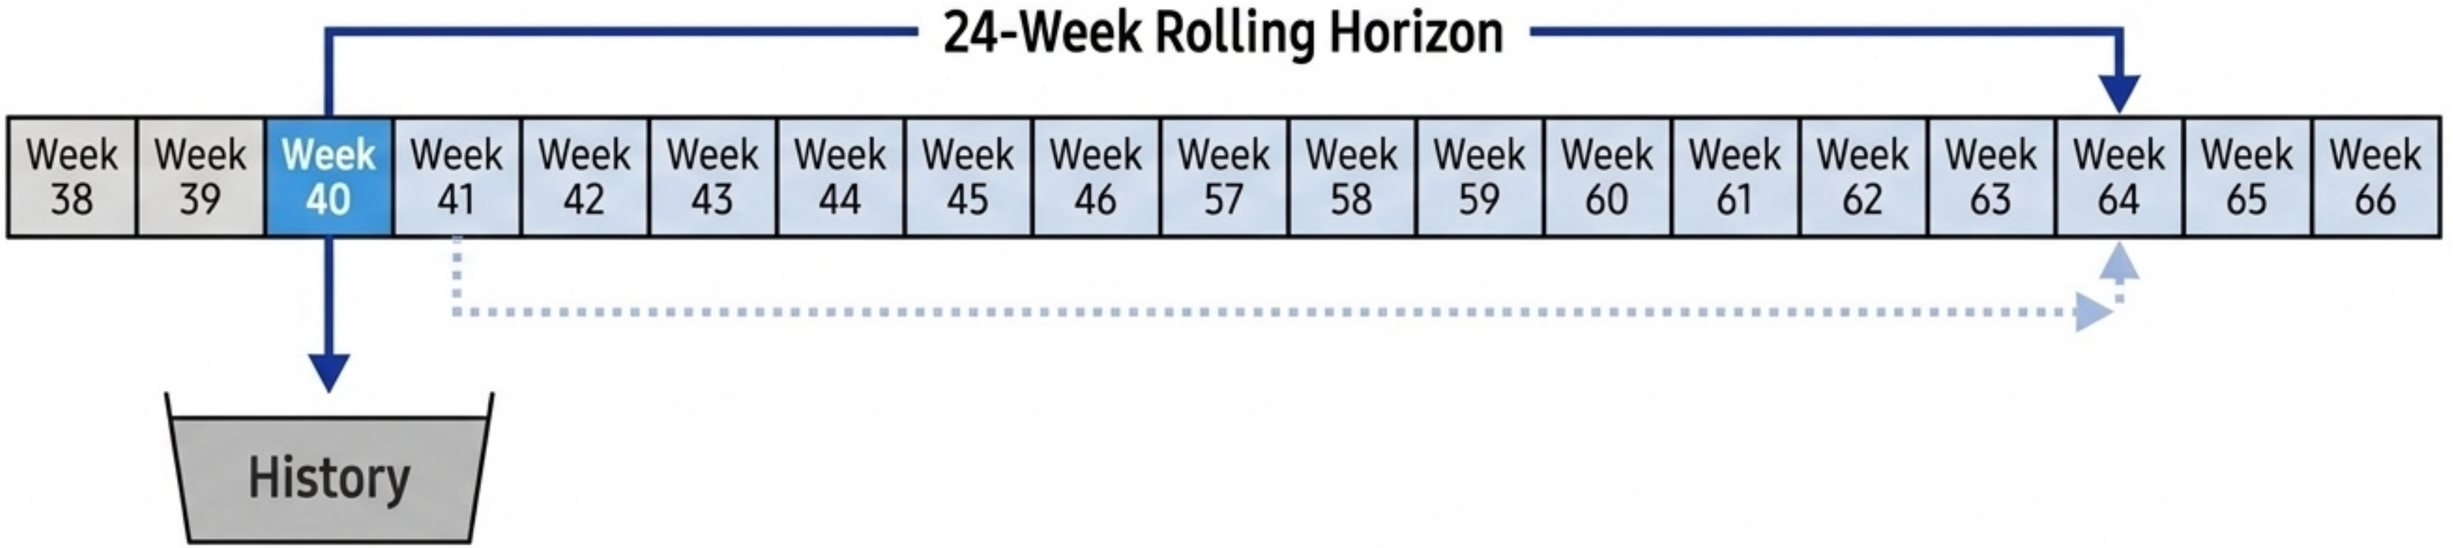

Sell-Through = Messages consumed from the queue.

Channel Inventory = The queue size.
If you publish faster than they consume, the queue blows up.

Core Insight: Sell-through is the TRUE demand signal. If Sell-In outpaces Sell-Through, Channel Inventory floods, and the account will halt future orders.

Gemini Notebook

24-Week Rolling Horizon Forecast

Weekly Buckets: The atomic unit of time (e.g., Week 42).

24-Week Rolling Horizon: Planning ~6 months out. Every week, the window moves forward by one, and ALL 24 weeks are re-forecasted.

The Cutoff: The weekly hard deadline to load the final forecast to the factory.

DEVELOPER TRANSLATION:

Rolling Horizon = A sliding window algorithm processing a time series.

The Cutoff = The weekly code freeze before a production release.

Gemini Notebook

ENDING = OPENING + PURCHASES - SALES

Model X at Carrier A				
Week	Opening	Purchases (Sell-In)	Sales (Sell-Through)	Ending
Week 41	2,000	800	1,000	1,800
Week 42	1,800	800	1,600	1,000
Week 43	1,000	1,200	900	

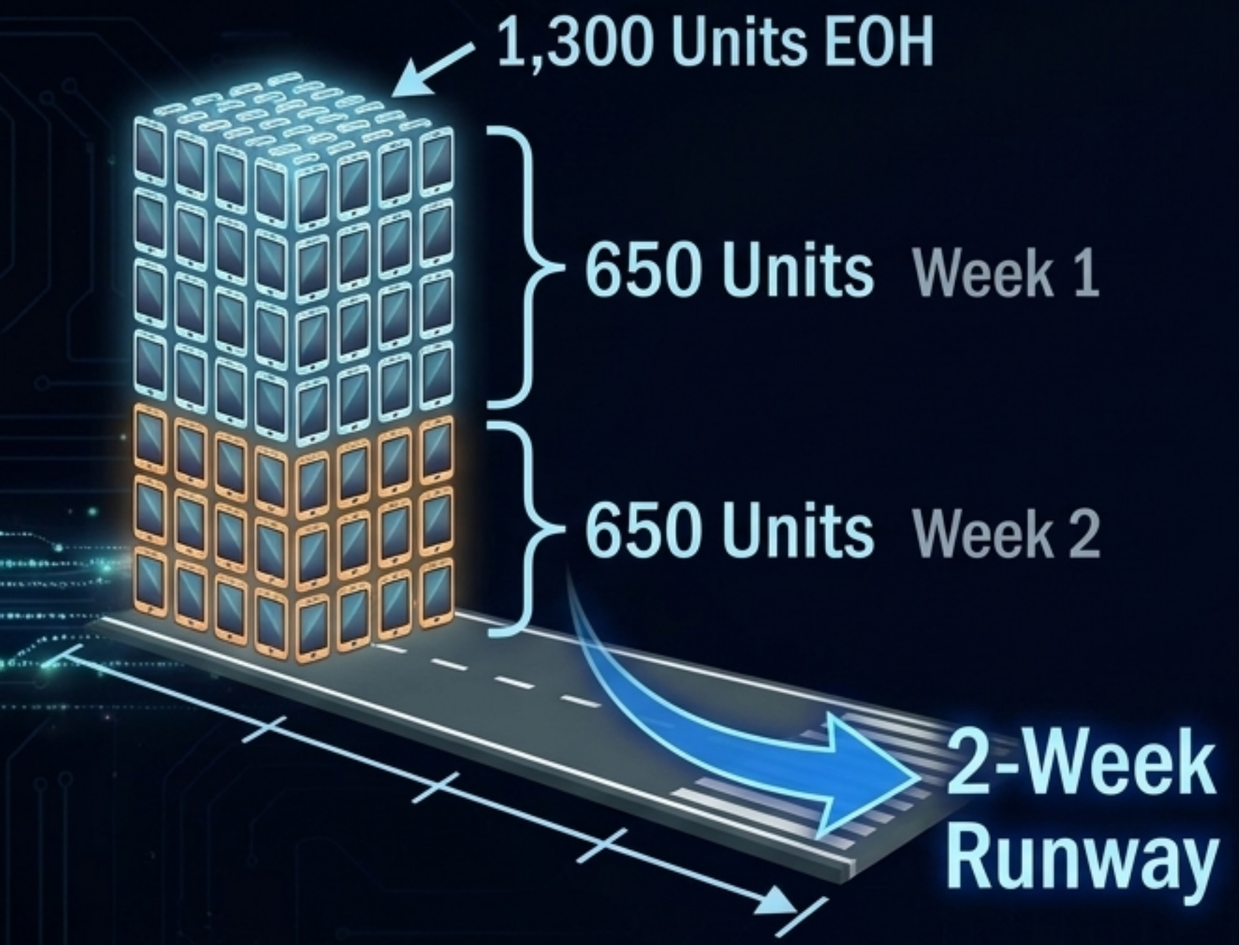

Analytical Catch: Sales spiked to 1,600. **Action:** Find the root cause (Promo? Data error?) before changing the future forecast!

DEVELOPER TRANSLATION:

It's a bank account ledger. The ending balance becomes next week's opening balance.

Gemini Notebook

Weeks of Supply (WOS) Calculation

$$\text{Weeks of Supply (WOS)} = \frac{\text{End On Hand (EOH)}}{\text{Average Forward Weekly Sales}}$$

Example:

You have 1,300 units EOH.

You expect to sell 650 a week.

1,300 / 650 = 2 Weeks of Supply.

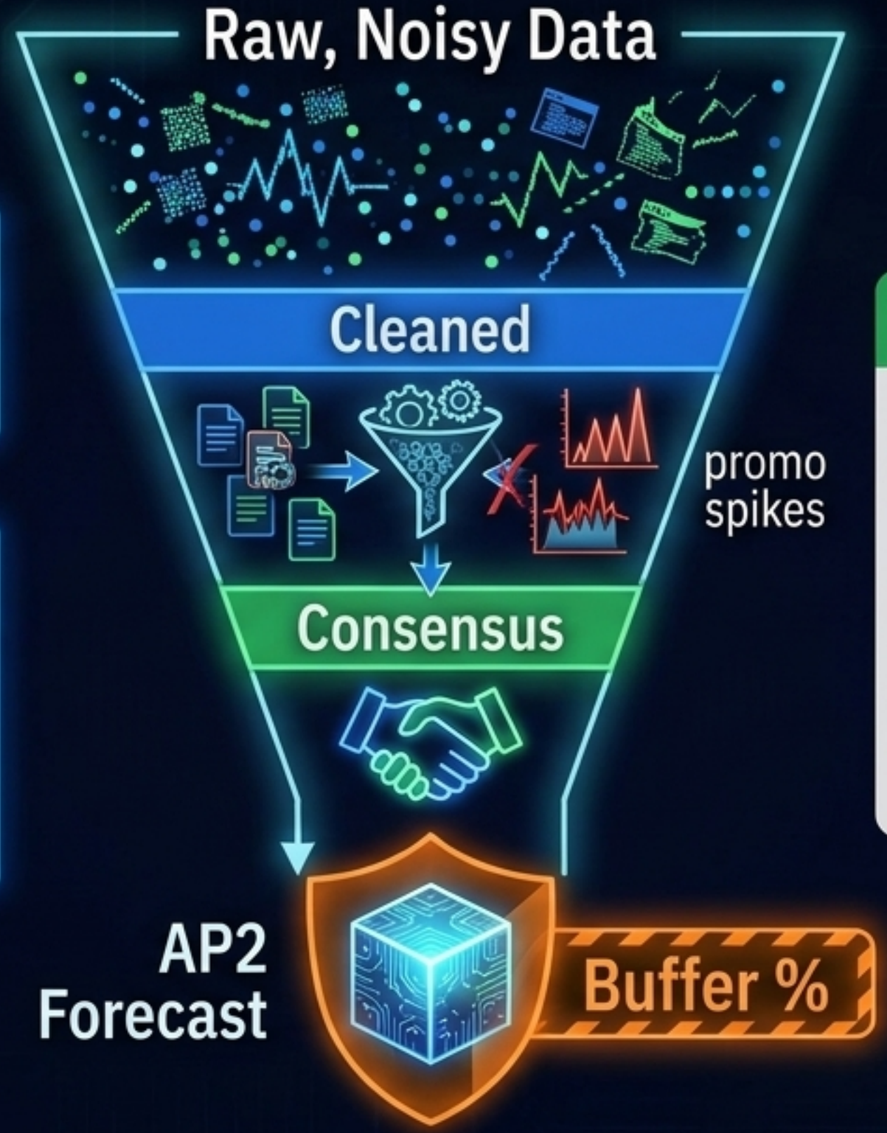

Strategic Action: If the account's target WOS is 4 weeks, we are 1,300 units short. Plan more sell-in. If WOS hits 12 weeks, stop sell-in immediately to prevent aging.

```
DEVELOPER TRANSLATION:
Disk runway calculation. Free Space / Daily Growth = Days until full.
```

Gemini Notebook

Demand Cleaning: Removing one-offs so they don't inflate the baseline.

AP2 Forecast: Samsung's internal term for the loaded Biz Ops forecast.
(Interview Tip: Ask them how they define the AP2 vs. AP1 cycle!)

Buffer Logic Math:

```
Loaded Qty = Consensus Forecast * (1 + Buffer %)

Example:
1,000 units * 1.05 (5% buffer)
= 1,050 units loaded.
```

DEVELOPER TRANSLATION: Provisioning server capacity headroom. Provision extra (5%) for a new app launch to prevent crashing, but shrink the buffer for an aging service.

Gemini Notebook

MAPE (Average % Error)	WAPE (Volume-Weighted Error)	Bias
Treats all items equally. Flaw: A tiny SKU selling 2 units instead of 10 causes a 400% error, ruining the metric.	$\Sigma\|F - A\| / \Sigma A$ The true business impact metric. (e.g., 38 error / 142 sales = 26.8% WAPE).	$\Sigma(F - A) / \Sigma A$ Shows direction. +5.4% means consistently over-forecasting.

Model	F	A	Error %
Model A	100	80	25%
Model B	50	60	16.7%
Model C	10	2	**400%** (Skews Average)

Core Insight: Persistent positive bias = aging inventory. You can have good accuracy but terrible bias.

DEVELOPER TRANSLATION: Evaluating a machine-learning model. WAPE is your overall loss function; Bias is a model that always predicts too high.

Gemini Notebook

The Weekly Report Structure

1. Top WoW changes & reasons.
2. Risks.
3. Gap to plan ($ and units).
4. Actions required.

DEVELOPER TRANSLATION: A weekly release changelog. What changed, why it changed, and the impact on the system.

Gemini Notebook

Reconciliation Walkthrough:

Found: 300 units are In-Transit (shipped but not received).

Found: 100 units are Pending Returns.

Math: 4,600 + 300 + 100 = 5,000. Reconciled.

DEVELOPER TRANSLATION: Investigating replication lag. Validating why Database A (Samsung) doesn't match Database B (Account) and tracing the mismatch to pending transactions.

Gemini Notebook

The Analyst's Toolkit (Action Levers)

Need 3,000.
Factory confirms 2,200.
Gap: 800 Short.

1. Expedite: Ship via air freight (Fast, but kills margin).

2. Reallocate: Prioritize key strategic accounts; short others temporarily.

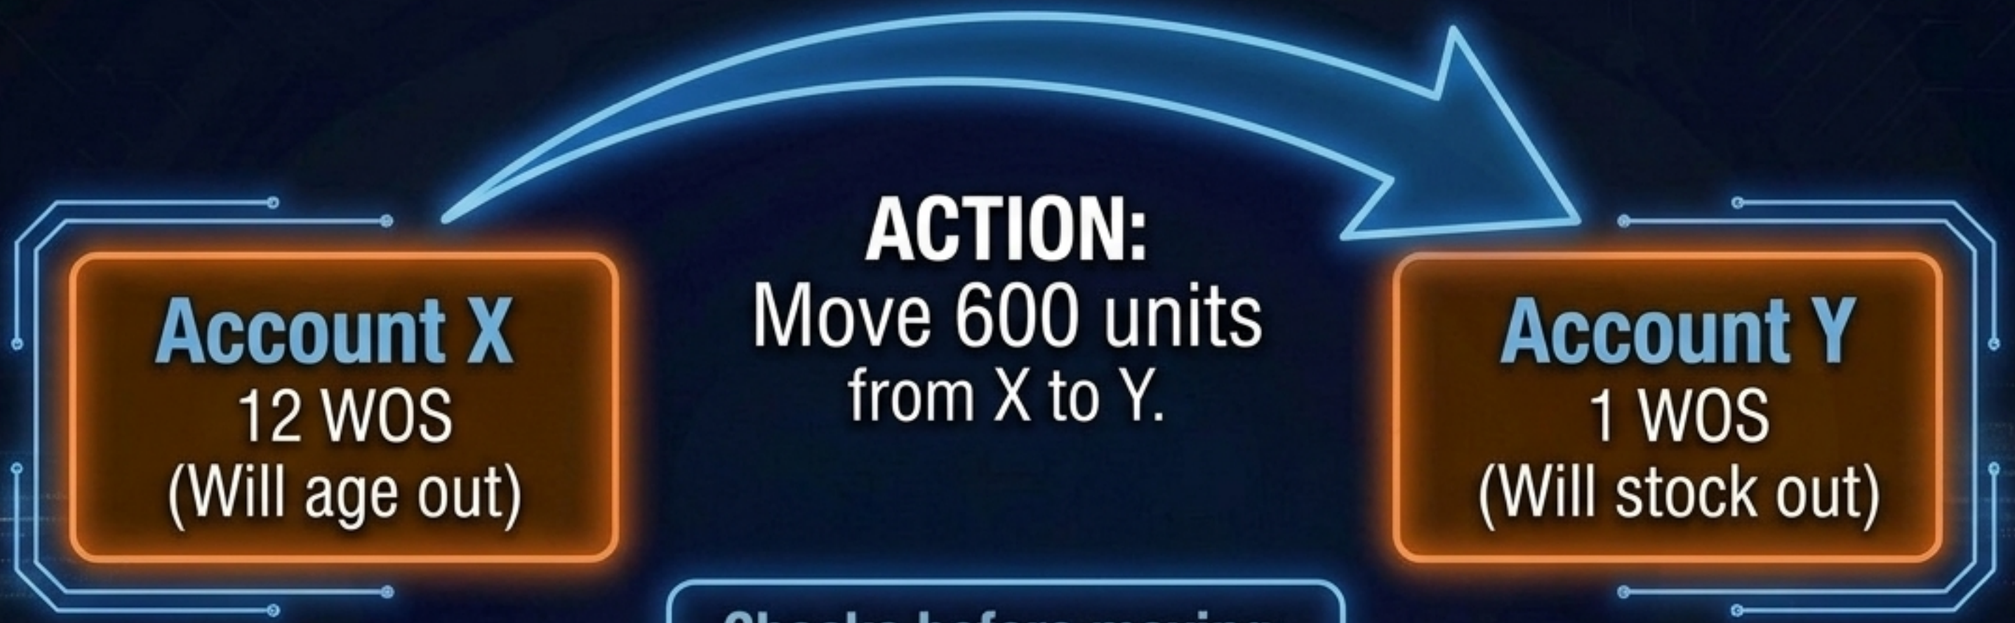

3. Pull Forward: Steal stock from a shipment scheduled for next week.

DEVELOPER TRANSLATION: A core dependency ships late. You must re-plan the release, triage features (allocation), and notify stakeholders immediately.

Gemini Notebook

Stock / Weekly Sell-Through = Weeks to Deplete

Checks before moving:

- ☐ Who owns the stock?
- ☐ Transfer costs?
- ☐ Promo calendars?

DEVELOPER TRANSLATION: Load balancing server requests from an overloaded node (Account X) to an idle node (Account Y).

Gemini Notebook

1. Headline

(Bottom Line Up Front)
“Q4 Demand is 8% above plan; supply covers 95%.”

2. Drivers

The 3 biggest reasons why (e.g., Carrier promo, competitor stock-out).

3. Risks

Aging inventory on old models, factory delays.

4. Decision

What you need from leadership today.

When Sales and Supply Disagree:
Don’t argue. Bring the data (WOS, accuracy history), document the assumptions, agree on one number, and track who was right next week.

```
DEVELOPER TRANSLATION: Sprint Planning. Getting cross-functional stakeholders in a room to agree on one prioritized backlog.
```

Gemini Notebook

Excel Requirement	SQL Equivalent	AI/Claude Usage Rule
PivotTable	GROUP BY (Account, Week)	Drafting WoW commentary from PSI tables
SUMIFS	SUM() WHERE (Condition = Model X)	Troubleshooting complex Excel nested formulas
XLOOKUP	LEFT JOIN on a unique key (Searches any direction, handles errors)	Never paste confidential data; manually verify every generated number

The Golden Rule of AI:
AI is a copilot, not an analyst. Verify every output.

DEVELOPER TRANSLATION: Sprint Planning. Getting cross-functional stakeholders in a room to agree on one prioritized backlog.

Gemini Notebook

The Honest Bridge Framework

Rule: NEVER claim a supply chain job or metric you don't have.

The Pivot: I haven't managed channel inventory, but at Accenture, I hunted down data mismatches across databases—the exact same investigative root-cause skillset.

Top Interview Questions

1. **Math:** Calculate WAPE and Bias. (Show the formulas: WAPE = (Σ|Forecast - Actual|) / ΣActual; Bias = (Σ(Forecast - Actual)) / ΣActual)
2. **Diagnostic:** Sell-through dropped 30%. What do you check? (Data error, promo ended, out of stock).
3. **Conflict:** Sales wants an inflated forecast. What do you do? (Bring data, document assumptions).
4. **System:** What is a rolling 24-week forecast? (Weekly buckets sliding forward).
5. **Reverse QA:** Ask them: "How does the AP2 cycle work here? How do you measure forecast bias today?"

You have the logic. You have the data skills. You are ready. Good luck on Monday.
